Short Biography

I am currently a final-year PhD student at University of Science and Technology of China. I have published more than 10 papers at top-tier conferences and journals, such as CVPR/ICCV/TIP. My research interests focus on multi-modal LLMs and trustworthy/efficient AI, including explainable LVLMs, efficient training/inference, AI privacy and robustness. I serve as the reviewer of conferences (e.g., CVPR, ICCV, NeurIPS) and journals (e.g., TPAMI). I am working closely with Dongdong Chen, Xiaoyi Dong, Jiaqi Wang, and Gang Hua.

Education

- 09/2020–present **PhD of Cyberspace Security**, *University of Science and Technology of China*, Hefei, China, CAS Key Laboratory of Electromagnetic Space Information. Supervised by Prof. Weiming Zhang, Prof. Nenghai Yu..
- 09/2016–06/2020 **Bachelor of Information Security**, *University of Science and Technology of China*, Hefei, China, Supervised by Prof. Weiming Zhang..

Experience

- 08/2023–present **Research Intern**, *Shanghai AI Laboratory*, Shanghai, China. Member of JQGroup, supervised by Xiaoyi Dong, Jiaqi Wang. Research in multi-modal LLMs, especially in cross-modal alignment/evaluation, efficient training/inference, and hallucination.
- 05/2022–07/2022 **Research Intern**, *iFlyTek Research*, Hefei, China. Member of Avatar strip, supervised by Shan He. Research in Chinese text-to-image model based on conditional diffusion, focusing on large-scale image-text datasets such as Wukong.

Skills

- ★ **Expertise in multi-modal LLMs** : My recent researches mainly focus on multi-modal large language models, including multi-modal hallucination, efficient MLLM training/inference, and cross-modal alignment. On these topics, I have published one paper about hallucination at CVPR 2024 and have two papers currently under review. One of the recent works is MIR&MoCa, where we propose an effective and reliable metric named MIR for quantifying MLLM pre-training, and a light-weight modality calibration module MoCa to facilitate cross-modal alignment. Another work is PyramidDrop, where we propose a multi-stage efficient training/inference framework for large vision-language models through vision redundancy reduction, especially working for high-resolution MLLMs. For MLLM hallucination, my representative work is OPERA, where we delve into the underlying causes of multi-modal hallucinations and give an explanation based on information attenuation. Based on this, we propose a training-free decoding algorithm to mitigate the hallucination issue. This work has earned over 50,000 reads and 4,000 shares on social media, with nearly 60 citations within six months.
- ★ **Expertise in efficient AI** : Except for the aforementioned PyramidDrop for efficient MLLM training/inference, I have been researching the parameter-efficient fine-tuning for vision pre-trained models and published one paper on CVPR 2023. This paper proposes DAM-VP, a data diversity-aware method for efficient and adaptive vision prompt learning. This work addresses the mismatch issue between vision prompts and downstream data diversity.

- ★ **Expertise in trustworthy AI** : I am currently curious about LLM safety/security and I have a work regarding jailbreak detection under review. Additionally, I have been researching the trustworthy issue for supervised/unsupervised vision models, where I published four paper (first author) on top-tier computer vision conferences. One is RobustMAE, which reveals the flaw of masked-autoencoder-style vision pre-training on adversarial robustness, and improve it with test-time frequency-domain prompting. Moreover, I have dedicated the early time of my PhD career to other topics, such as : 1) adversarial attack/defense methods for 3D models (e.g., SI-Adv and PointCAT, CVPR 2022 and TIP 2024); 2) backdoor attack for 2D models (e.g., Poison Ink, TIP 2022); 3) AIGC content safety for text-to-image diffusion models (e.g, SimAC, CVPR 2024); and 4) anti-DeepFake (e.g., AAAI 2021, where we are the first to propose the concept of “initiative defense” against DeepFakes by actively protecting users’ facial privacy before manipulation, differing from previous post-hoc measures like DeepFake detection.)
